

Exporting the data for analysis

To export the data we will show you how to do this through ODK Briefcase.

First download ODK Briefcase from the website link on this slide. You will need to ensure that the latest version of Java is installed on your machine.

You will need to set the download folder. This is where the data from the questionnaires will be decrypted and saved and therefore needs to be something secure e.g. not a file-sharing system such as Dropbox. To do this, click on the choose button for the storage location and select the folder. Next go to 'export' and click on 'edit default configuration' Here you will need to select the export directory and the PEM file location. The PEM file should be on your USB stick. You will need to double click on the private key.

To download the files we need to connect to the server. Click on pull from and select 'aggregate server' and click configure. Copy and paste the server URL until the word training/. Enter the username and password and click connect. Tick the form you want to download and click 'pull'.

Click on the export tab, select the form and click export. The downloaded, decrypted form will now be in your folder and ready for analysis.
